# Summary of findings

Search engines remain popular—and users are more satisfied than ever with the quality of search results—but many are anxious about the collection of personal information by search engines and other websites.

## Most search users disapprove of personal information being collected for search results or for targeted advertising

The Pew Internet & American Life survey in February 2012 included several questions probing how respondents feel about search engines and other websites collecting information about them and using it to either shape their search results or target advertising to them. Clear majorities of internet and search users disapprove of these practices in all the contexts we probed.

Specifically, the survey posed the following choices to search engine users:

- |                              |  |
|------------------------------|--|
| <b>65% say...</b>            | It's a BAD thing if a search engine collected information about your searches and then used it to rank your future search results, because it may limit the information you get online and what search results you see |
| <b>29% say...</b>            | It's a GOOD thing if a search engine collected information about your searches and then used it to rank your future search results, because it gives you results that are more relevant to you                         |
| <b>73% say they would...</b> | NOT BE OKAY with a search engine keeping track of your searches and using that information to personalize your future search results because you feel it is an invasion of privacy                                     |
| <b>23% say they would...</b> | Be OKAY with a search engine keeping track of your searches and using that information to personalize your future search results, even if it means they are gathering information about you                            |

All internet users were posed the following choice regarding targeted advertising:

- |                   |  |
|-------------------|--|
| <b>68% say...</b> | I'm NOT OKAY with targeted advertising because I don't like having my online behavior tracked and analyzed                         |
| <b>28% say...</b> | I'm OKAY with targeted advertising because it means I see advertisements and get information about things I'm really interested in |

## Overall views of search engine performance are very positive

For more than a decade, Pew Internet data has consistently shown that search engine use is one of the most popular online activities, rivaled only by email as an internet pursuit. In January 2002, 52% of *all Americans* used search engines. In February 2012 that figure grew to 73% of *all Americans*. On any given day in early 2012, more than half of adults using the internet use a search engine (59%). That is double the 30% of internet users who were using search engines on a typical day in 2004. And people's frequency of using search engines has jumped dramatically.

Moreover, users report generally good outcomes and relatively high confidence in the capabilities of search engines:

- 91% of search engine users say they always or most of the time find the information they are seeking when they use search engines
- 73% of search engine users say that most or all the information they find as they use search engines is accurate and trustworthy
- 66% of search engine users say search engines are a fair and unbiased source of information
- 55% of search engine users say that, in their experience, the quality of search results is getting better over time, while just 4% say it has gotten worse
- 52% of search engine users say search engine results have gotten more relevant and useful over time, while just 7% report that results have gotten less relevant

These findings are a backdrop for the ongoing policy debates about privacy, collection of personal information online, and the enthusiasm for targeted search and targeted advertising among companies. They also arise as Google implements a new privacy policy in which information about users' online behavior when they are signed into Google's programs can be collected and combined into a cohesive user profile. This includes material from Google's search engine, the Google+ social networking site, YouTube video-sharing site, and Gmail.

## Most internet users say they do not know how to limit the information that is collected about them by a website

Just 38% of internet users say they are generally aware of ways they themselves can limit how much information about them is collected by a website. Among this group, one common strategy people use to limit personal data collection is to delete their web history: 81% of those who know ways to manage the capture of their data do this. Some 75% of this group uses the privacy settings of websites to control what's captured about them. And 65% change their browser settings to limit the information that is collected.<sup>1</sup>

---

<sup>1</sup> There are a range of other strategies that users can employ, including the deletion of cookies and the use of anonymizing software and proxies that were not part of this survey.

## Overall, search users are confident in their abilities

Most search users say they are confident in their own search abilities, and find what they are looking for most of the time. More than half of search users (56%) say they are *very* confident in their search abilities, while only 6% say they are not too or not all confident. And the vast majority of search users report being able to find what they are looking for always (29%) or most of the time (62%).

## Positive search experiences are more common than negative experiences

Asked about different experiences they have had using search engines, more users report positive experiences than negative. They said in their use of search engines they had:

- learned something new or important that really helped them or increased their knowledge (86% of search users have had this experience)
- found a really obscure fact or piece of information they thought they would not be able to find (50%)
- gotten conflicting information in search results and not been able to figure out what is correct (41%)
- gotten so much information in a set of results that you feel overwhelmed (38%)
- found that critical information is missing from search results (34%)

## Google continues to be the most popular search engine, by a wide margin

Google continues to dominate the list of most used search engines. Asked which search engine they use most often, 83% of search users say Google. The next most cited search engine is Yahoo, mentioned by just 6% of search users. When we last asked this question in 2004, the gap between Google and Yahoo was much narrower, with 47% of search users saying Google was their engine of choice and 26% citing Yahoo.

## About the survey

These are the findings from a survey conducted from January 20-February 19, 2012 among 2,253 adults age 18 and over, including 901 cell phone interviews. Interviews were conducted in English and Spanish. The margin of error for the full sample is plus or minus 2 percentage points.

# Main findings

## Search engine use over time

A February 2012 Pew Internet survey finds that 91% of online adults use search engines to find information on the web, up from 84% in June 2004, the last time we did an extended battery of survey questions about people's search engine use. On any given day online, 59% of those using the Internet use search engines. In 2004 that figure stood at just 30% of internet users.

As early as 2002, more than eight in ten online adults were using search engines, and as we noted in an August 2011 report<sup>2</sup>, search is only rivaled by email both in the overall percent of internet users who engage in the activity and the percent of internet users doing it on a given day. The table below shows how search compares over time with some other popular online activities.

### Over time, search has remained one of the most popular internet activities

*% of internet users who do each activity*

**Source:** The Pew Research Center's Internet & American Life Project tracking surveys, 2002-2012. Social network site use not tracked prior to February, 2005. For more activity trends, go to [pewinternet.org](http://pewinternet.org). "Get news online" and "buy a product online" have not yet been asked in 2012 surveys.

<sup>2</sup> See "Search and Email Still Top the List of Most Popular Online Activities," available at <http://www.pewinternet.org/Reports/2011/Search-and-email.aspx>

Search is most popular among young adult internet users, those who have been to college, and those with the highest household incomes. These same groups—the young, college-educated, and affluent—are also most likely to report using a search engine “yesterday.” And while white and black online adults are more likely than Hispanics to report using search overall, white online adults stand out from all others as more likely to use search on a given day.

## Who uses search?

*% of online adults in each group who use search engines*

	% of each group who ever use search engines	% of each group who used a search engine yesterday
All online adults	91%	59%
<b>Gender</b>		
Male	90	59
Female	92	60
<b>Race/Ethnicity</b>		
White	93*	63*
African American	89*	44
Hispanic	79	44
<b>Age</b>		
18-29	96	66*
30-49	91	65*
50-64	92	52*
65+	80	38
<b>Education</b>		
Some high school	78	34
High school	88*	45*
Some college	94*	65*
College graduate	95*	74*
<b>Household income</b>		
< \$30,000	84	45
\$30,000 - \$49,999	93*	54*
\$50,000 - \$74,999	97*	66*
\$75,000+	95*	76*

\* Denotes statistically significant difference with other rows in that category

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. The margin of error is plus or minus 3 percentage points for internet users.

Asked how often they use a search engine to find information online, just over half of all search engine users (54%) say they do this at least once a day, a significant increase over 2004.

---

## Search users are turning to search engines more frequently

*% of adult search users who use a search engine to find information....*

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. An asterisk (\*) indicates a significant difference across years at the .95 confidence level.

---

Frequency of search engine use varies by age, education and income, with adults under age 50 and those with more education and higher household incomes using search more frequently than others.

## Daily searching is most common among younger, more educated and more affluent search engine users

Frequency of search engine use among each group of search users....

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish.

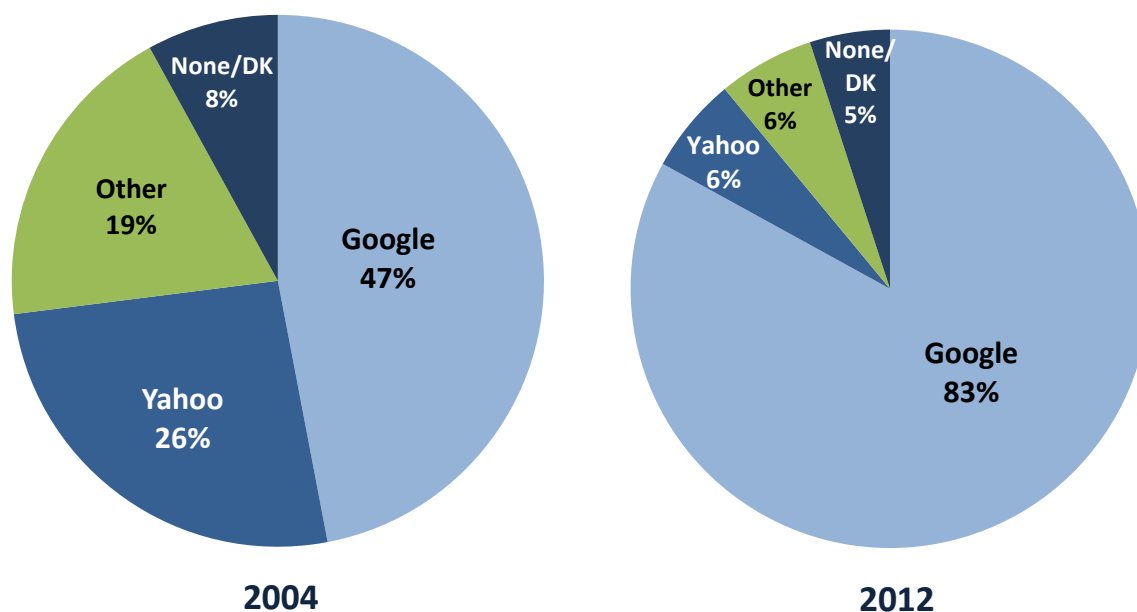

## Google is far and away the most popular search engine

Among search engine users, Google dominance continues and it is far and away the search engine they report using most often. Fully 83% of searchers use Google more often than any other search engine. Yahoo is a very distant second at just 6%. In 2004, the gap between these two search leaders was much narrower. At that time, 47% said that Google was the search engine they used most often while 26% named Yahoo.

---

## Google is far and away the search engine of choice, preferred by 83% of search users

*% of search users who answered the question: Which search engine do you use MOST OFTEN?*

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish.

---

## Quality of information

Fairly large majorities of search engine users express confidence in these tools and the results they generate. Not only does a majority believe that search engines are fair and unbiased, they also believe that most results are accurate and trustworthy. And most say that the quality and relevance of search results has been improving over time or has not changed, while very few see the quality and relevance of results declining.

## Bias and accuracy

There continues to be widespread faith in search results, and perceptions of fairness and bias have not changed at all over the past eight years. Roughly two-thirds of searchers (66%) say search engines are a fair and unbiased source of information. In 2004, 68% of search users said that search engines were a fair and unbiased source of information.

Asked how much of the information they get in search results is accurate or trustworthy, 28% say all or almost all and another 45% say most.

---

### Most adult search engine users have faith in the fairness and accuracy of their results

*In general, do you think Internet search engines are a fair and unbiased source of information, or do you think search engines are NOT a fair and unbiased source?*

*In general, how much of the information you find using search engines do you think is accurate or trustworthy?*

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish.

---

Younger search engine users have more faith in the results they get. 72% of 18-29 year-olds say that search engines are a fair and unbiased source, compared with 65% of 30-49 year-olds, 67% of 50-64 year-olds, and just 54% of search users age 65 and older.

Where accuracy and trustworthiness are concerned, women are slightly more likely than men (76% v. 69%) to feel that all or most of the results they get are accurate and trustworthy. Search users living in the highest income households are also slightly more likely than others to believe that all or most of their results can be trusted.

## Relevance and quality over time

Half of adult search users (52%) say search results have gotten *more relevant and useful* over time, while just 7% see them as getting less relevant or useful. The remaining 40% see no change over time. A similar question about changes in the *quality* of information over time yields similar results. Just over half of adult search users (55%) say that in their experience the quality of search results has gotten better over time, while 4% say the quality has gotten worse.

### Most adult search engine users say the relevance and quality of results are improving over time

Overall, in your experience, are search engine results getting *MORE* relevant and useful over time, *LESS* relevant and useful, or have you not seen any real difference over time?

Overall, in your experience, is the *QUALITY* of the information you get using search engines getting *BETTER* over time, *WORSE* over time, or have you not seen any real difference?

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish.

Adult search users under age 50 are slightly more likely than older search users to feel the quality of search results is improving over time. Older adult search users, in contrast, are more likely to see no difference in quality. There are no notable demographic differences where perceptions of relevance are concerned.

## Search users under age 50 are slightly more likely to say the quality of results is improving over time

Overall, in your experience, is the QUALITY of the information you get using search engines getting BETTER over time, WORSE over time, or have you not seen any real difference?

Source: The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. An asterisk (\*) indicates a significant difference across age groups at the 95% confidence level.

## Searchers' experiences and perceptions of their own abilities

Search engine users not only have confidence in the information they get using these tools, they also have confidence in their own search abilities and report finding what they are looking for most or all of the time.

In 2012, just over half of search users (56%) say they are *very confident* in their search abilities, which is a small but significant increase over 2004 when 48% felt this confident. Another 37% of search users today describe themselves as *somewhat* confident, with fewer than one in ten saying they are *not too* or *not at all* confident in their ability to use search engines to find information online.

---

## Search users are only slightly more confident in their search abilities than they were in 2004

How **CONFIDENT** do you feel about your own searching abilities when using a search engine to find information online?

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. An asterisk (\*) indicates a significant difference across years at the 95% confidence level.

---

Search users under age 50 are more likely to say they are *very* confident in their search abilities when compared with those age 50 and older (64% v. 40%), as are search users who have some college education when compared with those who do not (64% v. 45%). And while 68% of adults living in households with incomes of \$75,000 or greater say they are *very* confident in their ability to find information online using search engines, the same is true of only about half of adults in all other income ranges.

In addition to expressing more confidence, search users in 2012 are also slightly more likely than they were in 2004 to say that they *always* find the information they are looking for. While 29% of search engine users today say this is the case, just 17% reported the same in 2004. Still, in both 2012 and 2004, the majority of search users say they find what they are looking for *most* of the time, but not always.

While there are few notable demographic effects in terms of one's perception of their ability to find what they are looking for, the one group that stands out in this regard is adults living in the lowest income households. This group is more likely than any other to say they *always* find what they are looking for, with 37% reporting this.

---

## Search users in 2012 are more likely to report always finding the information they are searching for

When you use a search engine to look for information online, how often do you actually FIND the information you're looking for?

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. An asterisk (\*) indicates a significant difference across years at the 95% confidence level.

---

## More search users report more positive experiences than negative experiences

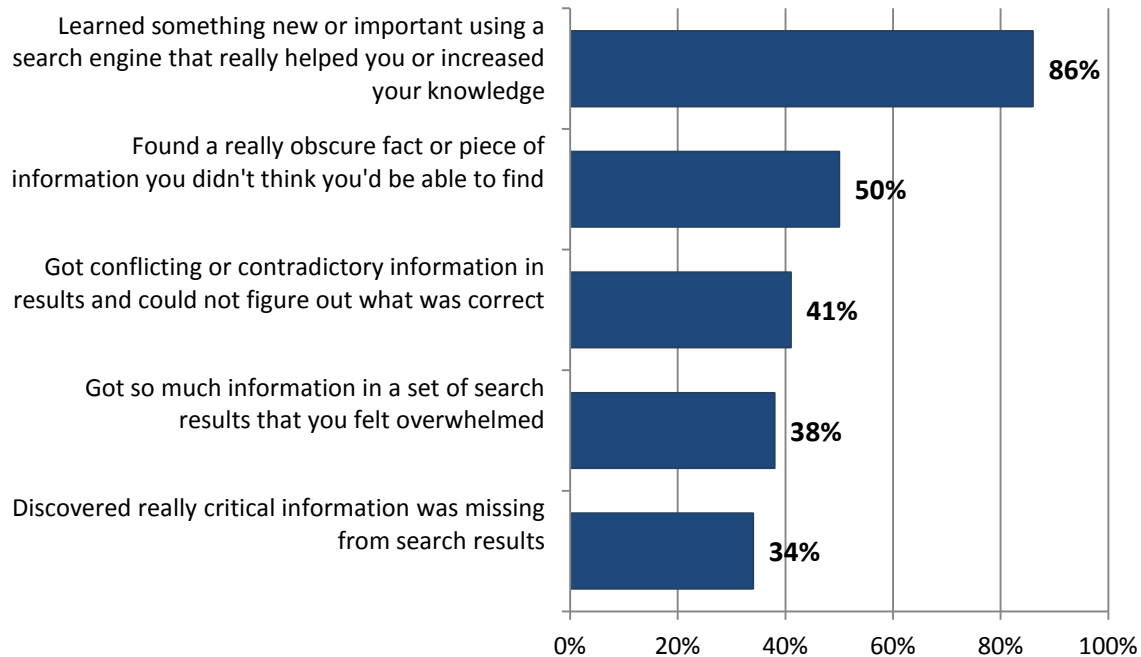

Given the largely positive view of the quality of information search engines yield, and their own search abilities, it is not surprising that many search users report positive experiences using these tools. More than eight in ten searchers say they have learned something new or important using a search engine that really helped them or increased their knowledge. And half say they were able to find a really obscure fact or piece of information using a search engine.

Yet despite these positive occurrences, many respondents also report having experienced the downside of search. Four in ten searchers say they have gotten conflicting or contradictory search results and could not figure out what information was correct. About four in ten also say they have gotten so much information in a set of search results that they felt overwhelmed. About one in three have had the experience of discovering that really critical or important information was missing from search results they got.

---

## More adult search users report positive experiences than negative experiences

*% of adult search engine users who have experienced each of the following...*

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. The margin of error is plus or minus 3 percentage points for total adult search users.

---

The experiences search engine users report vary slightly by education level, sex, and age. For example, college educated search engine users are more likely than those with less education to report having all five of the experiences asked about in the survey. And men are more likely than women to report finding obscure facts via search engines, getting conflicting information, and discovering that critical information is missing from their results.

## College educated search users are more likely to report having both positive and negative experiences

% of each group who have experienced each of the following...

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. An asterisk (\*) indicates a significant difference at the 95% confidence level.

Among adult search users, one's experiences using search engines also vary by age. Adults age 30-49, for example, are more likely than both their older and younger counterparts to report finding obscure information using search engines. Young adults, in contrast, are most likely to report getting conflicting or contradictory information in a set of results. The oldest adults, those age 50 and older, are most likely to report feeling overwhelmed by the amount of information in search results and least likely to report finding that critical information was missing from their search results.

## Male search users are more likely to report missing or conflicting information, but also finding obscure information

% of each group who have experienced each of the following...

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. An asterisk (\*) indicates a significant difference at the 95% confidence level.

## Some search users' experiences vary by age

% of each group who have experienced each of the following...

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. An asterisk (\*) indicates a significant difference at the 95% confidence level.

## Most have negative views of search engines and other sites collecting information about them

The survey asked respondents their views of search engines and other websites collecting information about them and using it to either shape their search results or target advertising to them. Overall, attitudes toward these practices are mixed, but the majority of internet and search users express disapproval.

This is especially relevant as Google implements a new privacy policy in which information about an individual's online behavior when they are signed in on any of Google's sites (including its search engine, Google+ social networking site, YouTube video-sharing site, and Gmail) can be collected and combined into a cohesive user profile. As the firm put it in a blog post:

"If you're signed in to Google, you expect our products to work really beautifully together. For example, if you're working on Google Docs and you want to share it with someone on Gmail, you want their email right there ready to use. Our privacy policies have always allowed us to combine information from different products with your account—effectively using your data to provide you with a better service. However, we've been restricted in our ability to combine your YouTube and Search histories with other information in your account. Our new Privacy Policy gets rid of those inconsistencies so we can make more of your information available to you when using Google."<sup>3</sup>

The company argues that the value of these user profiles is their ability to signal to marketers which products are likely to appeal to different individuals, thereby allowing them to target online advertising to those most likely to find it relevant and purchase products. Some privacy and consumer advocates argue that many consumers do not want to have personal information about them collected and that profiling process is often confusing to consumers, who don't know how they are being tracked and what profiling procedures determine what ads they see.

Our questions were designed to test these arguments. Two different questions probed searchers about whether they think it is okay for search engines to use information about them to rank their future search results. In the first version of the question, two-thirds of searchers feel it is a bad thing if a search engine collected information about their searches and then used it to rank their future search results, because it may limit the information you get online and what search results you see. Some 29% view the practice of tailoring search results favorably.

---

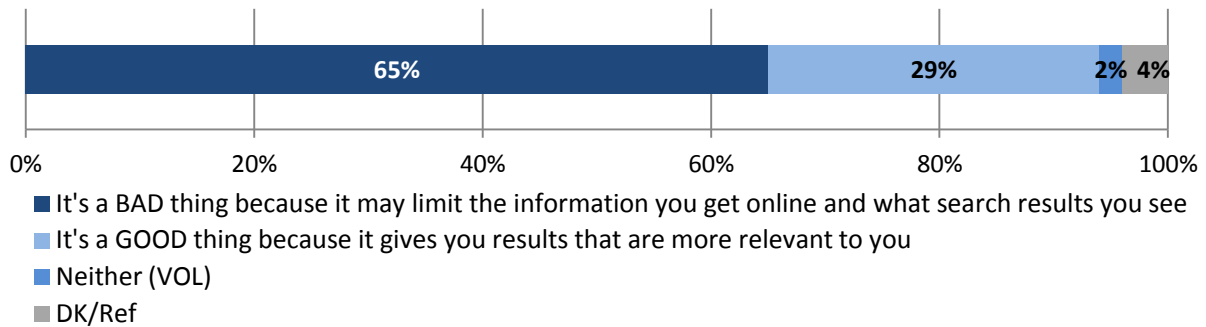

<sup>3</sup> See: <http://googleblog.blogspot.com/2012/02/googles-new-privacy-policy.html>

---

## Two-thirds of search users view personalized search results as a bad thing

*If a search engine kept track of what you search for, and then used that information to personalize your future search results, how would you feel about that?*

based on search users [n=812]

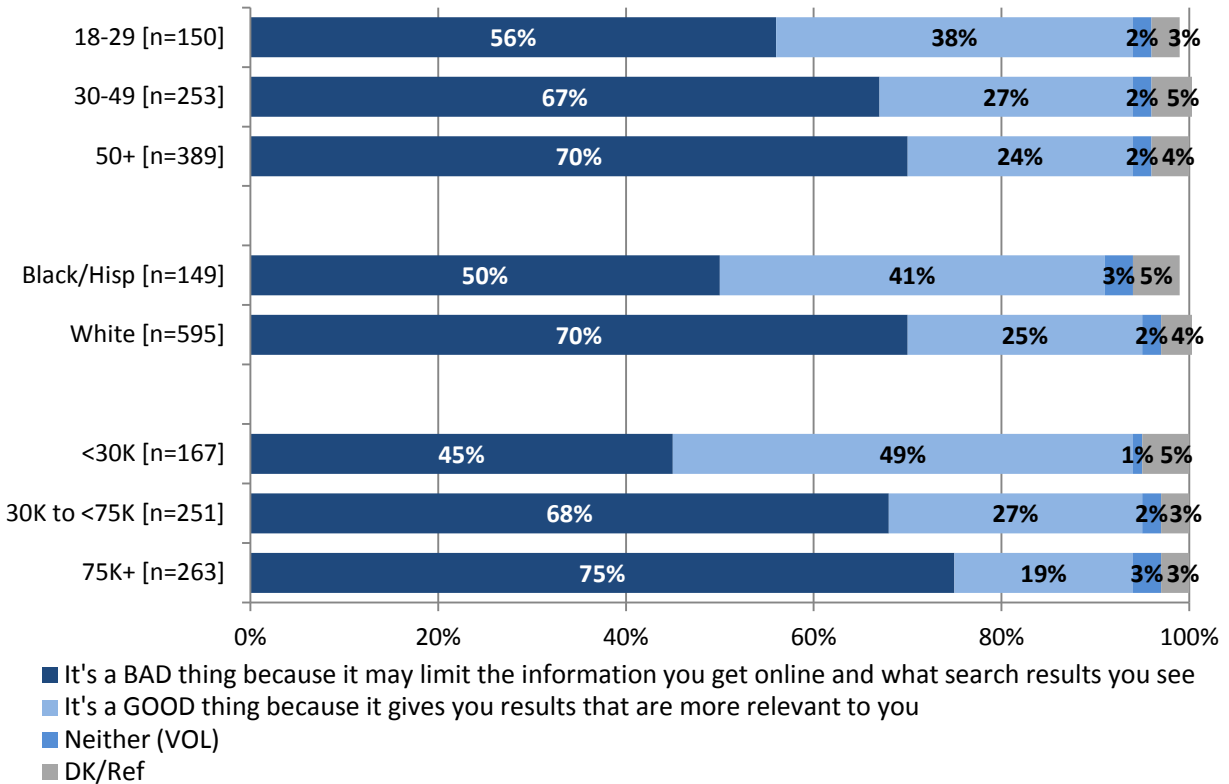

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish.

---

Search users' views of search engines collecting information about them vary slightly by age, race/ethnicity, and income. Younger search users (age 18-29) tend to view the practice more favorably, as do African-American/Hispanic adults when compared with white search users. Search users in the lowest income category (household income less than \$30,000 annually) are also more likely than higher income search users to say the practice of personalizing search results based on collected information about users is a good thing.

## Perceptions of personalized search results vary by age, race/ethnicity, and income

If a search engine kept track of what you search for, and then used that information to personalize your future search results, how would you feel about that?

Source: The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish.

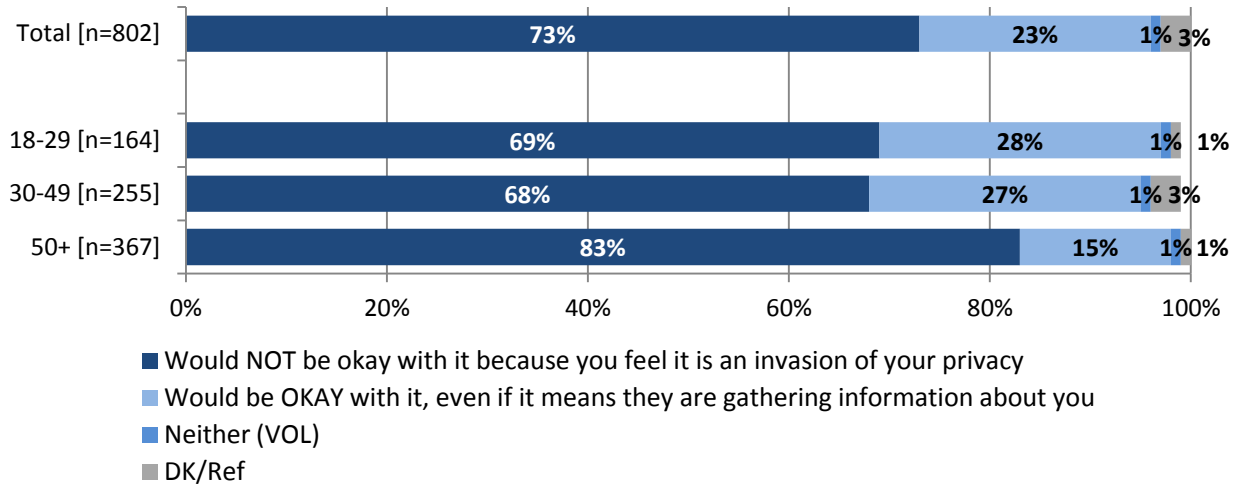

A different version of the question asking about personalized search results yields even more negative views. Almost three-quarters of searchers say they would NOT BE OKAY with a search engine keeping track of their searches and using that information to personalize their future search results because they see it as an invasion of privacy. This view holds constant across most demographic groups, with the exception of those age 50 and older, who are especially likely to view the practice negatively.

---

## Three-quarters of search users say collecting user information to personalize search results is not okay

*If a search engine kept track of what you search for, and then used that information to personalize your future search results, how would you feel about that?*

Based on search users [n=802]

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish.

---

## Targeted advertising: 59% of internet users have noticed it, but most don't like it

In addition to asking search users about personalized search results, all internet users were asked whether they had noticed ads being targeted to them online and more broadly, their opinion of targeted advertising. A majority (59%) say they themselves have noticed targeted advertising online – specifically, they have noticed advertisements online that are directly related to things they had recently searched for or sites they had recently visited.

### Who experiences targeted advertising online?

*Have you, personally, ever noticed advertisements online that are directly related to things you have recently searched for or sites you have recently visited, or has this never happened to you?*

	% of each group answering "yes"
<b>All online adults [n=1,729]</b>	<b>59%</b>
<b>Gender</b>	
Male [n=804]	62*
Female [n=925]	56
<b>Race/Ethnicity</b>	
White [n=1,229]	62*
African American [n=172]	51
Hispanic [n=184]	46
<b>Age</b>	
18-29 [n=316]	62*
30-49 [n=532]	62*
50-64 [n=521]	56*
65+ [n=320]	47
<b>Education</b>	
Some high school [n=108]	38
High school [n=465]	44
Some college [n=447]	64*
College graduate [n=698]	73*
<b>Household income</b>	
<\$30,000 [n=390]	48
\$30,000-\$49,999 [n=290]	57
\$50,000-\$74,999 [n=250]	67*
\$75,000+ [n=523]	69*

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. The margin of error is plus or minus 3 percentage points for total internet users. An asterisk (\*) indicates a significant difference across groups at the .95 confidence level.

The demographic groups most likely to report noticing targeted advertising online are men, white internet users, those under age 65, those who have been to college, and those living in higher income households. Three-quarters (73%) of college graduates have noticed online ads related to things they recently searched for or sites they recently visited, significantly higher than online adults with lower educational attainment. Likewise, online adults living in households with annual incomes of \$75,000 or greater are also especially likely to notice such ads, with 69% reporting having this experience.

Internet users were then asked how they feel about the practice of online targeted advertising. Roughly two-thirds of internet users (68%) have an unfavorable view of the practice, saying they are not okay with targeted advertising because they do not like having their online behavior tracked and analyzed. Some 28% said they are okay with targeted advertising because it means they see advertisements and get information about things they are really interested in.

---

## Two-thirds of internet users view online targeted advertising negatively

*Which of the following statements comes closest to how you, personally, feel about TARGETED ADVERTISING being used online – even if neither is exactly right?*

*Asked of adult internet users [n=1,729]*

- I'm NOT okay with it because I don't like having my online behavior tracked and analyzed
- I'm OKAY with it because it means I see ads and get information about things I'm really interested in
- Neither (VOL)
- DK/Ref

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. The margin of error is plus or minus 3 percentage points for internet users.

---

While a majority of every demographic group says they are not okay with online targeted advertising, younger internet users and those in the lowest income households are more likely than others to view the practice favorably. Yet, even among those groups, almost six in ten say they are not okay with targeted ads because they do not like having their online behavior tracked and analyzed.

## Views of targeted advertising vary by age and income

Which of the following statements comes closest to how you, personally, feel about TARGETED ADVERTISING being used online – even if neither is exactly right?

Asked of adult internet users [n=1,729]

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish.

## Most internet users say they do not know how to limit the information that is collected about them by a website

Just 38% of internet users say they are generally aware of ways they themselves can limit how much information about them is collected by a website. Among this group, one common strategy people use to limit personal data collection is to delete their web history: 81% of those who know ways to manage the capture of their data do this. Some 75% of this group uses the privacy settings of websites to control what's captured about them. And 65% change their browser settings to limit the information that is collected.<sup>4</sup>

---

### Just 38% of online adults say they are aware of ways to limit how much personal information websites can collect about them

*The percent of those who are aware of ways to limit information who have done each of the following...*

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish.

---

Online men are significantly more likely than women to report knowing ways to limit how much personal information websites can collect about them, as are white online adults when compared with African-Americans and Hispanics. Moreover, online adults who have been to college and those under age 50 are more likely than other online adults to report knowing how to do this.

---

<sup>4</sup> There are a range of other strategies that users can employ, including the deletion of cookies and the use of anonymizing software and proxies that were not part of this survey.

## Who knows how to limit websites' access to their personal information online?

*Are you aware of any ways internet users like yourself can limit how much personal information websites collect about you, or are you not aware of any ways to do this?*

**Source:** The Pew Research Center's Internet & American Life Project Winter 2012 Tracking Survey, January 20-February 19, 2012. N=2,253 adults, age 18 and older, including 901 cell phone interviews. Interviews conducted in English and Spanish. The margin of error is plus or minus 3 percentage points for total internet users. An asterisk (\*) indicates a significant difference across groups at the .95 confidence level.

# Methodology

This report is based on the findings of a survey on Americans' use of the Internet. The results in this report are based on data from telephone interviews conducted by Princeton Survey Research Associates International from January 20 to February 19, 2012, among a sample of 2,253 adults, age 18 and older. Telephone interviews were conducted in English and Spanish by landline (1,352) and cell phone (901, including 440 without a landline phone). For results based on the total sample, one can say with 95% confidence that the error attributable to sampling is plus or minus 2.3 percentage points. For results based Internet users (n=1,729), the margin of sampling error is plus or minus 2.7 percentage points. In addition to sampling error, question wording and practical difficulties in conducting telephone surveys may introduce some error or bias into the findings of opinion polls.

A combination of landline and cellular random digit dial (RDD) samples was used to represent all adults in the continental United States who have access to either a landline or cellular telephone. Both samples were provided by Survey Sampling International, LLC (SSI) according to PSRAI specifications. Numbers for the landline sample were selected with probabilities in proportion to their share of listed telephone households from active blocks (area code + exchange + two-digit block number) that contained three or more residential directory listings. The cellular sample was not list-assisted, but was drawn through a systematic sampling from dedicated wireless 100-blocks and shared service 100-blocks with no directory-listed landline numbers.

New sample was released daily and was kept in the field for at least five days. The sample was released in replicates, which are representative subsamples of the larger population. This ensures that complete call procedures were followed for the entire sample. At least 7 attempts were made to complete an interview at a sampled telephone number. The calls were staggered over times of day and days of the week to maximize the chances of making contact with a potential respondent. Each number received at least one daytime call in an attempt to find someone available. For the landline sample, interviewers asked to speak with the youngest adult male or female currently at home based on a random rotation. If no male/female was available, interviewers asked to speak with the youngest adult of the other gender. For the cellular sample, interviews were conducted with the person who answered the phone. Interviewers verified that the person was an adult and in a safe place before administering the survey. Cellular sample respondents were offered a post-paid cash incentive for their participation. All interviews completed on any given day were considered to be the final sample for that day.

Weighting is generally used in survey analysis to compensate for sample designs and patterns of non-response that might bias results. A two-stage weighting procedure was used to weight this dual-frame sample. The first-stage corrected for different probabilities of selection associated with the number of adults in each household and each respondent's telephone usage patterns.<sup>5</sup> This weighting also adjusts for the overlapping landline and cell sample frames and the relative sizes of each frame and each sample.

---

<sup>5</sup> i.e., whether respondents have only a landline telephone, only a cell phone, or both kinds of telephone.

The second stage of weighting balances sample demographics to population parameters. The sample is balanced to match national population parameters for sex, age, education, race, Hispanic origin, region (U.S. Census definitions), population density, and telephone usage. The Hispanic origin was split out based on nativity; U.S born and non-U.S. born. The White, non-Hispanic subgroup is also balanced on age, education and region. The basic weighting parameters came from a special analysis of the Census Bureau's 2011 Annual Social and Economic Supplement (ASEC) that included all households in the United States. The population density parameter was derived from Census 2000 data. The cell phone usage parameter came from an analysis of the July-December 2010 National Health Interview Survey.<sup>6</sup> Following is the full disposition of all sampled telephone numbers:

<b>Sample Disposition</b>		
Landline	Cell	
33,732	22,499	Total Numbers Dialed
1,396	274	Non-residential
1,483	47	Computer/Fax
8	---	Cell phone
14,936	8,237	Other not working
3,094	467	Additional projected not working
12,815	13,474	Working numbers
38.0%	59.9%	Working Rate
1,031	156	No Answer / Busy
4,290	5,288	Voice Mail
40	16	Other Non-Contact
7,454	8,014	Contacted numbers
58.2%	59.5%	Contact Rate
513	1,256	Callback
5,491	5,273	Refusal
1,450	1,485	Cooperating numbers
19.5%	18.5%	Cooperation Rate
67	41	Language Barrier
---	524	Child's cell phone
1,383	920	Eligible numbers
95.4%	62.0%	Eligibility Rate
31	19	Break-off
1,352	901	Completes
97.8%	97.9%	Completion Rate
11.1%	10.8%	Response Rate

<sup>6</sup> Blumberg SJ, Luke JV. Wireless substitution: Early release of estimates from the National Health Interview Survey, July-December, 2010. National Center for Health Statistics. June 2011.

The disposition reports all of the sampled telephone numbers ever dialed from the original telephone number samples. The response rate estimates the fraction of all eligible respondents in the sample that were ultimately interviewed. At PSRAI it is calculated by taking the product of three component rates:

- Contact rate – the proportion of working numbers where a request for interview was made
- Cooperation rate – the proportion of contacted numbers where a consent for interview was at least initially obtained, versus those refused
- Completion rate – the proportion of initially cooperating and eligible interviews that were completed

Thus the response rate for the landline sample was 11 percent. The response rate for the cellular sample was 11 percent.

# Survey questions

## Winter Tracking Survey 2012

Final Topline

02/22/2012

Data for January 20–February 19, 2012

Princeton Survey Research Associates International for  
the Pew Research Center's Internet & American Life Project

Sample: n=2,253 national adults, age 18 and older, including 901 cell phone interviews

Interviewing dates: 01.20.2012 – 02.19.2012

Margin of error is plus or minus 2 percentage points for results based on Total [n=2,253]

Margin of error is plus or minus 3 percentage points for results based on internet users [n=1,729]

Margin of error is plus or minus 3 percentage points for results based on cell phone owners [n=1,961]

Margin of error is plus or minus 3 percentage points for results based on SNS users [n=1,047]

Margin of error is plus or minus 3 percentage points for results based on SNS or Twitter users [n=1,062]

Margin of error is plus or minus 3 percentage points for results based on Total who use search engines [n=1,614]

Margin of error is plus or minus 4 percentage points for results based on Form A who use search engines [n=812]

Margin of error is plus or minus 4 percentage points for results based on Form B who use search engines [n=802]

**Q37b** Overall, in your experience, is the QUALITY of the information you get using search engines getting BETTER over time, WORSE over time, or have you not seen any real difference?

Based on Form B respondents who use search engines [N=802]

	<u>CURRENT</u>	
%	55	Quality getting better

4	Quality getting worse
39	No difference in quality over time
2	Don't know
*	Refused

**Q38a** If a search engine kept track of what you search for, and then used that information to personalize your future search results, how would you feel about that? Would you say... [READ AND ROTATE 1-2]?

Based on Form A respondents who use search engines [N=812]

	<u>CURRENT</u>	
%	65	It's a BAD thing if a search engine collected information about your searches and then used it to rank your future search results, because it may limit the information you get online and what search results you see (OR)
	29	It's a GOOD thing if a search engine collected information about your searches and then used it to rank your future search results, because it gives you results that are more relevant to you (OR)
	2	(DO NOT READ) Neither of these
	3	(DO NOT READ) Don't know
	1	(DO NOT READ) Refused

**Q38b** If a search engine kept track of what you search for, and then used that information to personalize your future search results, how would you feel about that? Would you...[READ AND ROTATE 1-2]?

Based on Form B respondents who use search engines [N=802]

	<u>CURRENT</u>	
%	73	NOT BE OKAY with a search engine keeping track of your searches and using that information to personalize your future search results because you feel it is an invasion of privacy (OR)
	23	Be OKAY with a search engine keeping track of your searches and using that information to personalize your future search results, even if it means they are gathering information about you (OR)
	1	(DO NOT READ) Neither of these
	2	(DO NOT READ) Don't know
	1	(DO NOT READ) Refused

**Q39** As you may know, businesses sometimes use TARGETED ADVERTISING to reach online consumers. Targeted advertising uses information about a person’s online behavior collected by websites and search engines to determine what advertisements that person will see online.

Have you, personally, ever noticed advertisements online that are directly related to things you have recently searched for or sites you have recently visited, or has this never happened to you?

Based on all internet users [N=1,729]

	<u>CURRENT</u>	
%	59	Yes, I’ve noticed this
	39	No, this hasn’t happened to me
	2	Don’t know
	*	Refused

**Q40** Which of the following statements comes closest to how you, personally, feel about TARGETED ADVERTISING being used online – even if neither is exactly right? [READ AND ROTATE 1-2]

Based on all internet users [N=1,729]

	<u>CURRENT</u>	
%	68	I’m NOT OKAY with targeted advertising because I don’t like having my online behavior tracked and analyzed (OR)
	28	I’m OKAY with targeted advertising because it means I see advertisements and get information about things I’m really interested in (OR)
	2	(DO NOT READ) Neither of these
	1	(DO NOT READ) Don’t know
	1	(DO NOT READ) Refused

**Q41** Are you aware of any ways internet users like yourself can limit how much personal information websites collect about you, or are you not aware of any ways to do this?

Based on all internet users [N=1,729]

	<u>CURRENT</u>	
%	38	Yes, aware of ways to do this
	60	No, not aware of any ways to do this
	1	Don’t know
	*	Refused

**Q42** Have you, personally, done any of the following to limit the information websites gather about you? (First,/Next,) How about...[INSERT ITEM; RANDOMIZE]? Have you done this, or not?

Based on those who are aware of ways to limit personal information collected by websites [N=633]

	YES, HAVE DONE THIS	NO, HAVE NOT DONE THIS	DON'T KNOW	REFUSED
